PROFILE

Systems-integration and full-stack developer with 5+ years of professional experience across enterprise payments, location-based VR and Ontario public-sector health systems. Translate client and SME needs into data integrations, APIs, database logic, tests and production releases. Recent independent work includes one year of AI-assisted delivery across data integration, workflow automation, prototyping and technical documentation.

CORE CAPABILITIES

Systems integration • Requirements analysis • Data extraction, normalization & validation • API/service integration • Batch & scheduled workflows • Test planning & UAT • Production support / root-cause analysis • Technical documentation • AI-assisted development & verification • Agile / Jira / Confluence

TECHNOLOGY

Java • Spring • C#.NET • JavaScript/TypeScript • Angular • SQL • Oracle PL/SQL • HTML/CSS • REST/SOAP/gRPC • protobuf • XML/JSON • Git/Jenkins • Jira/Confluence • Postman • Unix/Bash • Unity/VR • OpenAI Codex/ChatGPT

PROFESSIONAL EXPERIENCE

Full-Stack Software Engineer — Secret Location | May 2018–Apr 2019

- Sustained a location-based VR distribution/hosting platform spanning C#.NET services, gRPC/protobuf, Unity client components, Angular/TypeScript dashboards, local station/host software and media/video workflows.
- Traced data flows across 20+ system components, solved cross-layer failures and assisted peers with debugging; worked with asynchronous/event-driven code, Steam/OpenVR, Oculus/OVR and FFMPEG.
- Delivered production changes without QA regressions and added 70+ unit tests; performed VR QA and supported usability/reliability improvements.
- Collaborated with engineering, QA and UX/strategy. Public colleague recommendations cite readable/flexible code, rapid learning, detail and proactive improvements across development, QA and user experience.

Full-Stack Software Engineer — Paymentus | Dec 2014–May 2017

- Integrated a PCI-compliant payments platform with multiple client Customer Information Systems (CIS) and vendor systems for real-time web-service transactions and scheduled/offline batch ingestion; supported web, kiosk, POS and IVR payment flows.
- Built and sustained ETL-style data handling: mapped vendor formats, parsed records, validated/normalized fields, marshalled XML and used Oracle PL/SQL/stored procedures for high-volume payment/account data loads.
- Translated biller/business requirements into Java/SQL/web changes across presentation, business logic and persistence; reconciled conflicting requirements, improved performance and kept core-product behavior separate from client customization.
- Implemented REST extensions, tokenization/security-related changes and data-validation logic; supported legacy/newer portal behavior and enterprise communication/client-campaign features.

- Diagnosed issues across PROD, SIT, UAT, QA and local environments using logs, SQL, remote debugging, configuration analysis and exception traces.
- Coordinated stable fixes/releases across development, implementation, operations, management/business analysis and client-facing teams; worked with Agile/Scrum/Kanban, Jira, Confluence, Git and Jenkins.

EARLIER PUBLIC-SECTOR & INDEPENDENT WORK

Programmer Analyst (Co-op) — Ontario Ministry of Health | Jun 2011–Apr 2013

- Analyzed IBM Panorama and legacy immunization-system fields/data, identified gaps and HL7/storage limitations, developed robust queries and collaborated with immunization SMEs, technical management and IBM DBA specialists.
- Built a JavaScript/Excel dashboard showing status of ~30 servers, simplifying a detailed operational dataset; designed requirements/UI for another developer to expose queries through a simplified interface.
- Created EasyForm, a .NET/Excel alternative form interface with two-way spreadsheet interaction; early records describe independent design and later derivative reuse.

SELECTED TECHNICAL PROJECTS

AI-Assisted Software Projects — Toronto | 2025–Present

- Personal analytics ecosystem (Codex, ChatGPT, OneNote and ActivityWatch): directed development of interconnected extraction, normalization and refresh pipelines feeding searchable dashboards with links back to source records.
- Media and transcription operations: developed Android/cloud workflows for inventory and backup verification, bulk video tagging and action flags for later operations such as deletion, plus queued WhisperX transcription/diarization and searchable outputs.
- SunWalks: prototyped a Unity planning tool integrating solar geometry, weather and route data with 3D shadows, time-of-day tinting and controls to advance or jump the simulation to any time of day.
- Accessibility and reusable delivery tooling: developed AutoHotkey input aids and PromptPilot, a low-cognitive-load framework for scoped requirements, reusable documentation, verification criteria and technical handoffs.

Independent / Technical Projects — Toronto | 2013–2026

- Scientific visualization (2025–2026): created Blender-based technical figures used in two peer-reviewed publications, iterating with researchers from incomplete references while separating visualization work from scientific authorship.
- Wave Challenge (2018): ingested employee/expense CSV through a web form into a relational database, calculated monthly totals, returned results in a web UI, added a REST API and documented technical decisions/trade-offs.
- Game Maker's Union (President, 2 years; 2010–2016): organized game jams, led small project teams, taught technical/design concepts and contributed to 20–30 C# prototypes.
- Breath Trainer (2013–2014): independently developed an extensible JavaScript web application and tested/ported mobile prototypes.

LANGUAGES

French — Professional working proficiency | English — Native speaker

EDUCATION

B.Sc. Computer Science — Toronto Metropolitan University (Ryerson), 2014 | Co-op & Dean's List
